## Installation and Execution

### Noise to Signal C+

1. open path `.../FrontEnd/src/executables/apply_noise_to_signal/` in terminal
2. run `"make"`
4. run `"./delay_generator"`

#### Type of files

`main.c` – main file to execute the functions

`noise_to_signal.c` – all signal functions are stored here to be executed by `main.c`

`noise_to_signal.h` – header file

`makefile` - build file

`readme` - guide to run

### Delay Generator C+

1. open path `.../FrontEnd/src/executables/delay_generator/` in terminal
2. make sure having `delays.csv` in the same directory
3. run `"make"`
4. run `"./delay_generator "`

#### Type of files

`main.c` – main file to execute the functions

`delay_generator.c` – all signal functions are stored here to be executed by `main.c`

`delay_generator.h` – header file

`delays.csv` – csv file that store all the delays value

`makefile` - build file

`readme` - guide to run

### Fractal Delay Application Python

1. open path `.../FrontEnd/src/executables/fractal_delay_application/` in terminal

2. make sure having delays.csv in the same directory
3. run "python main.py" to generate noise.csv file

#### **Type of files**

main.py – main file to execute the functions (optimized version)

utils.py – main function (old version)

delays.csv – csv file that store all the delays value

### **Noise Generator Python**

1. open path .../FrontEnd/noise\_generator/ in terminal
2. run "python main.py" to generate noise.csv file

#### **Type of files**

main.py - main file to execute

### **Subfile Generator C+**

1. open path .../FrontEnd/subfile\_generator/ in terminal
2. make sure having configfile.csv, delays.csv, signals.csv, noise.csv in the same directory
3. run "make"
4. run "./subfile\_generator"

#### **Type of files**

frannor.c - library that give normally distributed gaussian random float

frannor.h - define fields and functions

subfile\_generator.c - functions to load files and combine to final .subfile

makefile - build file

readme - guide to run

delays.csv - contain delays values

noise.csv - contain noise values

configfile.csv - contain settings values

signal.csv - contain signal values

## Functionality

### Noise to Signal C+

```
float* readFile(char* filename, int sample_size, int channels)
```

#### Description

Read the file for the delay value

#### Parameters

char – char file name

sample\_size – integer sample\_size

channels – integer number of channels

#### What the function Returns

Return nothing

### Delay Generator C+

```
char* generateOutputFilename()
```

#### Description

Generate the timestamp of the output filename

#### Parameters

Nothing

#### What the function Returns

Return the file

```
bool generateRandomDelays(char* outputFilename)
```

#### Description

Generate the random delay and then write it to a file

#### Parameters

outputFilename – char file name

#### **What the function Returns**

Return true if the file has been successfully written, else false

### **Fractal Delay Application**

resample(signal, sample\_size, original\_sample\_size)

#### **Description**

Resample the signal value

#### **Parameters**

signal – the signal value

sample\_size – the sample size value

original\_sample\_size – the original sample size value

#### **What the function Returns**

Return the resampled signal values

generate\_complex\_wave(sample\_size, magnitude=127)

#### **Description**

Generate the complex wave by calculating the x and y value using the formula of  $2.0 * \pi * \text{random sample size}$

#### **Parameters**

sample\_size – the sample size value

magnitude – the wave magnitude

#### **What the function Returns**

Return the x and y value

generate\_complex\_noise(sample\_size, snr=1, magnitude=127)

#### **Description**

Generate the complex wave by calculating the x and y value using the formula of  $2.0 * \pi * \text{random sample size}$

**Parameters**

sample\_size – the sample size value

snr – scale value

magnitude – the wave magnitude

**What the function Returns**

Return the x and y value

```
generate_gauss(sample_size, magnitude=127)
```

**Description**

Generate the gaussian white noise signal

**Parameters**

sample\_size – the sample size of the signal

magnitude – the noise magnitude

**What the function Returns**

Return the signal wave

```
generate_impulse(duration, baseline, sample_size, amplitude=127)
```

**Description**

Generate the impulse signal and then plot the graph out

**Parameters**

duration – the duration of the impulse wave

baseline – the baseline of the impulse wave

sample\_size – the signal sample size

amplitude – the amplification of the impulse wave

**What the function Returns**

Return the y and i value

```
generate_sine(frequency, baseline, sample_size, amplitude=127, phase=None)
```

**Description**

Generate the sinusoidal wave and plot the graph out

**Parameters**

frequency – the frequency of the sine wave

baseline – the baseline of the wave

sample\_size – the signal sample size

amplitude – the amplification of the sine wave

phase – the phase mode for the phasing of the sine wave

**What the function Returns**

Return the x and y value

```
read_delay_file(filename="delays.csv")
```

**Description**

Read the delay value from the file

**Parameters**

filename – the file name

**What the function Returns**

Return the delay values

```
delay_signal(signal, delay)
```

**Description**

Get the signal with the delay value and then calculate it

**Parameters**

signal – the signal value

delay – the delay value

**What the function Returns**

Return the calculated delay value for the signal

`apply_delay(signal, delay)`

**Description**

Apply the delay value to the signal and shift it

**Parameters**

signal – the signal value

delay – the delay value

**What the function Returns**

Return the shifted value of the signal

`splice_signal(signal, step)`

**Description**

Splice the signal based on the step

**Parameters**

signal – the signal value

step – the amount of step requires to splice

**What the function Returns**

Return the spliced signal

`reset_output_file(filename)`

**Description**

Reset the file by removing the old path name

**Parameters**

filename – the file name

**What the function Returns**

Return nothing

write\_signal(signal, filename)

**Description**

Write the generated signal into the file

**Parameters**

signal – the signal value

filename – the file name

**What the function Returns**

Return nothing

write\_original\_signals(signal, sampled\_signal, filename)

**Description**

Write the original signals to the file

**Parameters**

signal – the signal value

sampled\_signal – the sampled signal value

filename – the file name

**What the function Returns**

Return nothing
